#1: Standalone Components

ANGULAR
ARCHITECTS
INSIDE KNOWLEDGE

NgModules + EcmaScript Modules

```
import { NgModule } from '@angular/core';
import { BrowserModule } from '@angular/platform-browser';

import { AppComponent } from './app.component';
[...]
```

Angular Modules  **TypeScript Modules** 

```
@NgModule({
  imports: [BrowserModule, OtherModule],
  declarations: [AppComponent, OtherComponent, OtherDirective],
  providers: [],
  bootstrap: [AppComponent],
})
export class AppModule {}
```

Standalone Components

```
@Component({
  standalone: true,
  imports: [
    [...],
    FlightCardComponent,
    CityPipe,
    CityValidator,
  ],
  selector: 'flight-search',
  templateUrl: '...'
})
export class FlightSearchComponent {
  [...]
}
```

Standalone Components

```
@Component({
  standalone: true,
  imports: [
    [...],
    FlightCardComponent,
    CityPipe,
    CityValidator,
  ],
  selector: 'flight-search',
  templateUrl: '...'
})
export class FlightSearchComponent {
  [...]
}
```

Click-Dummy

```
<my-comp *ngIf="show">  
</my-comp>
```

It looks like you want to use
NgIfDirective and *MyComponent*.
Shall I import it for you?

Dylan Hunn

@dylhunn

As of [#Angular](#) v15, the language service will be able to automatically suggest imports for selectors! This is very useful with standalone components, since you don't already have your NgModule imports. (But it works with NgModules also!) [@angular](#)

[Tweet übersetzen](#)

```
import { Component } from '@angular/core';
import { CommonModule } from '@angular/common';

@Component({
  selector: 'standalone-boo',
  standalone: true,
  template: `
    <standalone-foo></standalone-foo>
  `,
  styles: [],
  imports: [CommonModule]
})

export class StandaloneBooComponent {}
```

Quick Fix...

- Import StandaloneFooComponent from '../standalone-foo'

Standalone Components & Architecture?

ANGULAR
ARCHITECTS
INSIDE KNOWLEDGE

Small and Medium Apps: Folder per Feature

```

  ✓ app
    > +state
    > about
    ✓ booking
      > +state
      > flight-card
      > flight-edit
      > flight-search
      > passenger-search
      > utils
      <> flight-booking.component.html
      TS flight-booking.component.ts
      TS flight-booking.routes.ts
      TS index.ts
```

```

  ✓ app
    > +state
    > about
    ✓ booking
      > +state
      > flight-card
      > flight-edit
      > flight-search
      > passenger-search
      > utils
      <> flight-booking.component.html
      TS flight-booking.component.ts
      TS flight-booking.routes.ts
      TS index.ts

```

Your Public APIs: Barrels

```
// index.ts == Public API
```

```
export *  
  from './flight-booking.routes';
```

- ✓ src
 - ✓ app
 - > +state
 - > about

- ✓ domains

- ✓ boarding

- > checkin

- > luggage

- > shared

- > ticketing

Medium and Large Apps: Folder per Domain

Restricting Access b/w Domains, etc.
on a library basis

Smart, Fast
Extensible
Build System

Restricting Access b/w Domains, etc. on a folder basis

Migration to Standalone

ANGULAR
ARCHITECTS
INSIDE KNOWLEDGE

Migration Scripts in Angular 15.2+

```
ng g @angular/core:standalone
```

```
npm
C:\> ng g @angular/core:standalone
? Choose the type of migration: (Use arrow keys)
> Convert all components, directives and pipes to standalone
  Remove unnecessary NgModule classes
  Bootstrap the application using standalone APIs
```

#2:

Custom Standalone APIs

Registering Providers

```
bootstrapApplication(AppComponent, {  
  providers: [  
    [...]  
  ]  
});
```

Registering Providers

```
bootstrapApplication(AppComponent, {  
  providers: [  
    importProvidersFrom(HttpClientModule),  
    importProvidersFrom(RouterModule.forRoot(APP_ROUTES)),  
  ]  
});
```

Standalone APIs

```
bootstrapApplication(AppComponent, {  
  providers: [  
    provideHttpClient(),  
    provideRouter(APP_ROUTES),  
  ]  
});
```

Standalone APIs

```
bootstrapApplication(AppComponent, {  
  providers: [  
    provideHttpClient(  
      withInterceptors([authInterceptor]),  
    ),  
    provideRouter(APP_ROUTES,  
      withPreloading(PreloadAllModules),  
      withDebugTracing(),  
    ),  
  ]  
});
```

Custom Standalone APIs

```
bootstrapApplication(AppComponent, {  
  providers: [  
    provideLogger(loggerConfig),  
  ]  
});
```

Custom Standalone APIs

```
bootstrapApplication(AppComponent, {  
  providers: [  
    provideLogger(loggerConfig,  
      withColor({ debug: 3 })  
    ),  
  ]  
});
```

Whenever possible, use

```
@Injectable({  
  providedIn: 'root'  
})
```

ANGULAR
ARCHITECTS
INSIDE KNOWLEDGE

However, if you need to pass a config ...

```
bootstrapApplication(AppComponent, {  
  providers: [  
    provideLogger(loggerConfig,  
      withColor({ debug: 3 })  
    ),  
  ]  
});
```

#3: Functional Services

ANGULAR
ARCHITECTS
INSIDE KNOWLEDGE

Functional Guards

```
export const APP_ROUTES: Routes = [  
  [...]  
  {  
    path: 'flight-booking',  
    canActivate: [() => inject(AuthService).isAuthenticated()],  
    component: FlightBookingComponent  
  },  
]
```

Functional Guards

```
export const APP_ROUTES: Routes = [  
  [...]  
  {  
    path: 'flight-booking',  
    canActivate: [() => inject(AuthService).isAuthenticated()],  
    component: FlightBookingComponent  
  },  
]
```

Functional Resolvers

```
export const APP_ROUTES: Routes = [  
  [...]  
  {  
    path: 'flight-booking',  
    canActivate: [() => inject(AuthService).isAuthenticated()],  
    resolve: {  
      flights: () => inject(FlightService).findAll()  
    },  
    component: FlightBookingComponent  
  },  
]
```

Functional Interceptors

```
export const authInterceptor: HttpInterceptorFn = (req, next) => {  
  [...]  
}
```

Registering the Interceptor

```
bootstrapApplication(AppComponent, {  
  providers: [  
    provideHttpClient(  
      withInterceptors([authInterceptor]),  
    ),  
  ]  
});
```

Bring Your Own Functional Services

```
bootstrapApplication(AppComponent, {  
  providers: [  
    provideLogger({  
      level: LogLevel.DEBUG,  
      appenders: [DefaultLogAppender],  
      formatter: (level, cat, msg) => [level, cat, msg].join(';'),  
    })),  
  ],  
});
```

Signals in a Nutshell

Component Without Signals

```
flights: Flight[] = [];
```

```
const flights = await this.flightService.findAsPromise(from, to);  
this.flights = flights;
```

```
<div *ngFor="let f of flights">  
  <flight-card [item]="f" />  
</div>
```

Component With Signals

```
flights = signal<Flight[]>([]);
```

```
const flights = await this.flightService.findAsPromise(from, to);  
this.flights.set(flights);
```

```
<div *ngFor="let f of flights()">  
  <flight-card [item]="f" />  
</div>
```
